Business Analysis & Insights

1. Executive Summary

The analysis covers 10 employees and records total sales of ₹394,000, with the recorded sales generated by Sales department employees. Priya recorded the highest individual sales at ₹91,000, followed by Aisha at ₹85,000, and Simran at ₹78,000. Average employee attendance is 91%. Sales department employees with attendance of at least 90% account for ₹254,000 of total sales. Four employees have attendance below 90%, including two Sales employees. While the dataset highlights differences between attendance and sales performance, it does not provide sufficient evidence to establish a causal relationship between the two. Management should therefore use these findings as areas for further investigation rather than definitive conclusions.

2.Key KPIs

KPI	Result
Total Employees	10
Total Sales	₹394,000
Average Sales	₹39,400
Average Attendance	91%
Highest Sales	₹91,000
Top Salesperson	Priya
Sales Dept.- Attendance >=90%	₹254,000
Total Salary	₹354,000
Average Salary	₹35,400

3.Key Findings

- **Top Salesperson:** Priya recorded the highest sales at ₹91,000.
- **Sales Performance:** The dataset records ₹394,000 in total sales, all attributed to Sales department employees.
- **Attendance:** The average attendance across the 10 employees is 91%, while four employees have attendance below 90%.
- **Attendance and Sales:** Sales department employees with attendance of at least 90% generated ₹254,000, while Sales employees below 90% attendance generated ₹140,000.

4. Management Questions

Rather than inventing conclusions, we'll show management what should be investigated:

1. Is there a consistent relationship between attendance and sales over multiple months?
2. Why do some sales employees have attendance below 90%?
3. Why does the dataset contain sales only for Sales department employees?
4. Are sales targets and bonus thresholds aligned with current performance?
5. Would a larger time period provide a more reliable view of employee performance?

5. Recommendations

Management should continue monitoring sales and attendance together, particularly for Sales employees below the 90% attendance threshold. Before drawing conclusions about the relationship between attendance and sales, management should analyze a larger dataset covering multiple periods. The reporting structure should also be reviewed to confirm whether zero sales for non-Sales departments are expected or represent missing data.

Management Report- Sales Performance Review

1. Executive Summary

A concise overview of overall performance.

2. Performance Highlights

- Total Sales: ₹394,000
- Top Salesperson: Priya- ₹91,000
- Average Attendance- 91%
- Sales from Sales employees with >=90% attendance: ₹254,000

3. Areas Requiring Attention

- Four employees have attendance below 90%.
- Two Sales employees below 90% attendance account for ₹140,000 in sales.
- The dataset should be reviewed to confirm whether zero sales for non-Sales departments are expected.

4. Recommendations

- Continue monitoring sales and attendance together.
- Review attendance patterns over a longer period.
- Validate whether the reporting structure accurately represents non-Sales departments.
- Avoid drawing conclusions about causation from this dataset alone.

5. AI Analysis & Verification

Generative AI was used to assist with formula development, summarization, and interpretation of the dataset. AI-generated outputs were independently checked against the Excel calculations and source data before being included in this report.

6. Conclusion

The analysis provides a snapshot of sales performance, attendance, and employee-level results. The findings can help management identify areas for further investigation, while additional historical data would be required for more comprehensive performance analysis.
